# OVERVIEW

---

1. **Motivation: Simulation of Resistivity Logging Instruments.**
2. **Methodology:**
  - The *hp*-Finite Element Method (FEM).
  - Self-Adaptive *hp*-FEM.
  - **Self-Adaptive Goal-Oriented *hp*-FEM.**
3. **Numerical Results:**
  - Simulation of Resistivity Logging Instruments with Casing.
  - Simulation of Resistivity Logging Instruments with Mandrel.
4. **Conclusions and Future Work (3D Problems, Multi-physics).**

# RESISTIVITY LOGGING INSTRUMENTS

---

## Logging Instruments: Definition

# RESISTIVITY LOGGING INSTRUMENTS

## Utility of Logging Instruments

**OBJECTIVES:** To determine

- Payzones (oil and gas).
- Amount of oil/gas.
- Ability to extract oil/gas.

**\$**

# RESISTIVITY LOGGING INSTRUMENTS

**Main Objective: To Solve an Inverse Problem**

**A software for solving the DIRECT problem is essential in order to solve the INVERSE problem**

## Model Problem with Steel Casing

Frequency: 10 Hz - 10 kHz.

Casing resistivity:  $10^{-6}$  Ohm · m.

Casing width: 0.01127 m

Discretization error < 0.1 %

Toroidal antennas

Size (domain): 500m x 4000m

# THE $hp$ -FINITE ELEMENT METHOD (FEM)

---

## The $h$ -Finite Element Method

1. Convergence limited by the polynomial degree, and large material contrasts.
2. Optimal  $h$ -grids do NOT converge exponentially in real applications.
3. They may “lock” (100% error).

## The $p$ -Finite Element Method

1. Exponential convergence feasible for analytical (“nice”) solutions.
2. Optimal  $p$ -grids do NOT converge exponentially in real applications.
3. If initial  $h$ -grid is not adequate, the  $p$ -method will fail miserably.

## The $hp$ -Finite Element Method

1. Exponential convergence feasible for ALL solutions.
2. Optimal  $hp$ -grids DO converge exponentially in real applications.
3. If initial  $hp$ -grid is not adequate, results will still be great.

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Motivation (Goal-Oriented Adaptivity)

### Test Problem

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Motivation (Goal-Oriented Adaptivity)

### Test Problem

- **Solution decays exponentially.**
- $\frac{|E(T)|}{|E(R)|} \approx 10^{60}$
- **Results using energy-norm adaptivity:**
  - Energy-norm error: 0.001%
  - Relative error in the quantity of interest  $> 10^{30}$  %.

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Motivation (Goal-Oriented Adaptivity)

### Test Problem

- **Solution decays exponentially.**
- $\frac{|E(T)|}{|E(R)|} \approx 10^{60}$
- **Results using energy-norm adaptivity:**
  - Energy-norm error: 0.001%
  - Relative error in the quantity of interest  $> 10^{30}$  %.

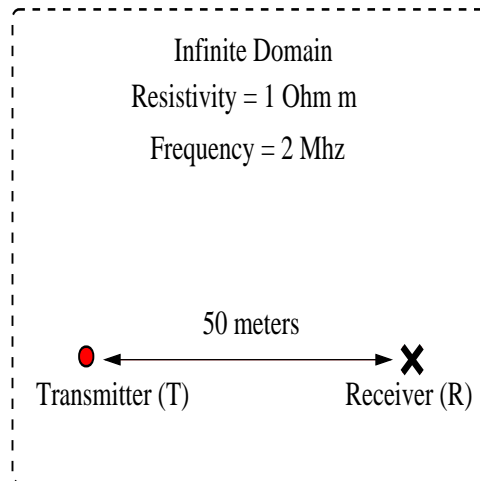

## Goal-oriented adaptivity is needed

Becker-Rannacher (1995,1996), Rannacher-Stuttmeier (1997), Cirak-Ramm (1998), Paraschivoiu-Patera (1998), Peraire-Patera (1998), Prudhomme-Oden (1999, 2001), Heuveline-Rannacher (2003), Solin-Demkowicz (2004).

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Motivation (Goal-Oriented Adaptivity)

### Test Problem

**Goal-oriented adaptivity is needed**

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Mathematical Formulation (Goal-Oriented Adaptivity)

We consider the following problem (in variational form):

$$\begin{cases} \text{Find } L(\Psi), \text{ where } \Psi \in V \text{ such that :} \\ b(\Psi, \xi) = f(\xi) \quad \forall \xi \in V . \end{cases}$$

We define residual  $r_e(\xi) = b(e, \xi)$ . We seek for solution  $G$  of:

$$\begin{cases} \text{Find } G \in V'' \sim V \text{ such that :} \\ G(r_e) = L(e) . \end{cases}$$

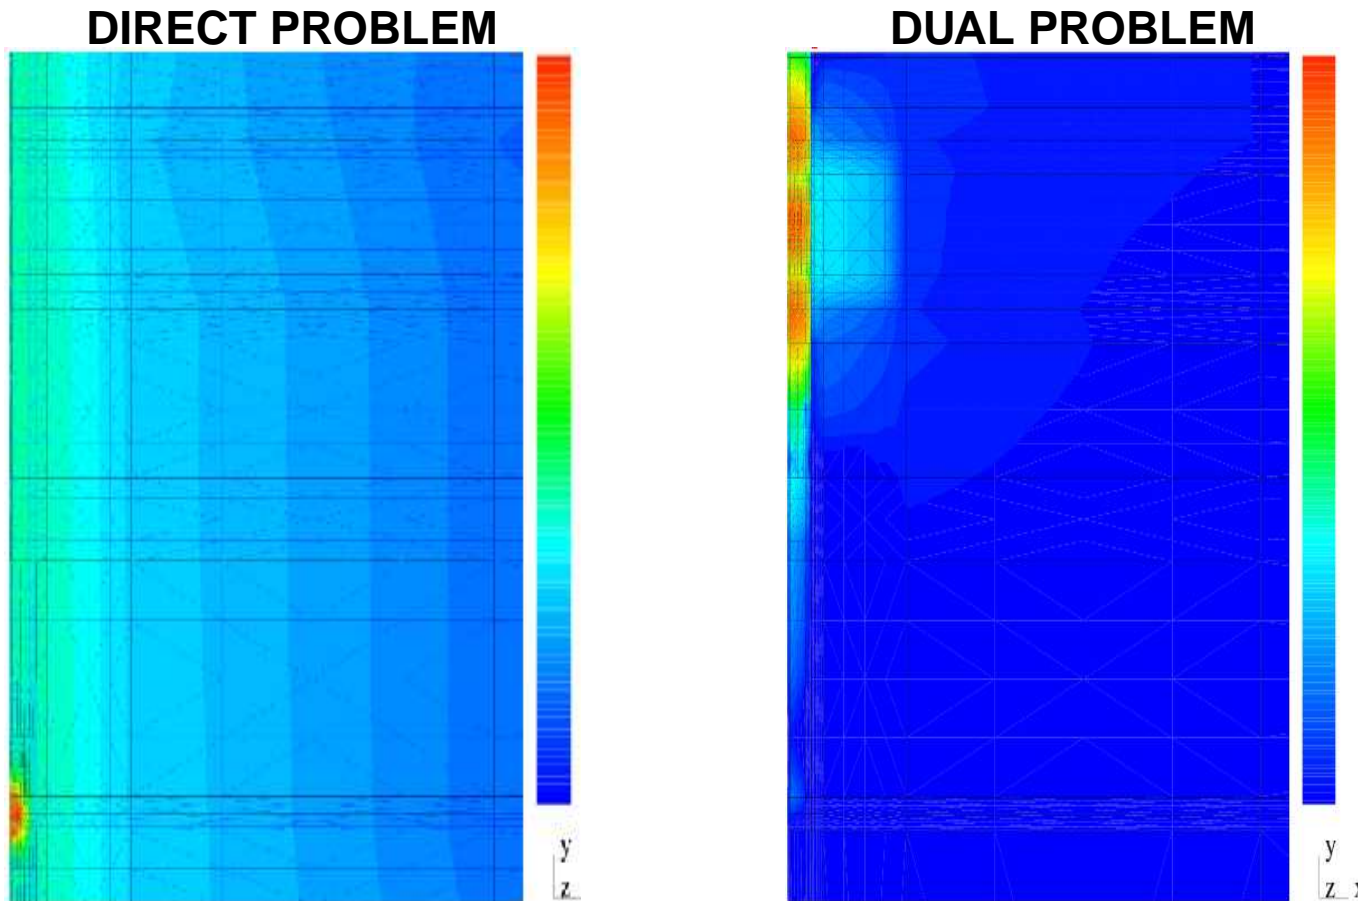

This is necessarily solved if we find the solution of the *dual* problem:

$$\begin{cases} \text{Find } G \in V \text{ such that :} \\ b(\Psi, G) = L(\Psi) \quad \forall \Psi \in V . \end{cases}$$

Notice that  $L(e) = b(e, G)$ .

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Mathematical Formulation (Goal-Oriented Adaptivity)

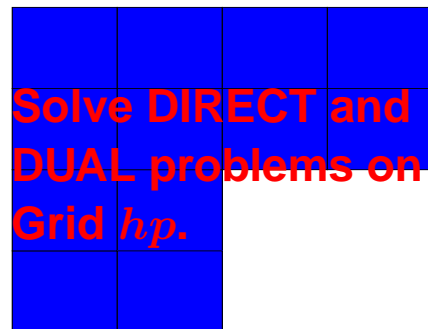

$$L(\Psi) = b(\Psi, G)$$

# SELF-ADAPTIVE GOAL-ORIENTED $hp$ -FEM

## Algorithm for Goal-Oriented Adaptivity

Compute  $e = \Psi_{h/2,p+1} - \Psi_{hp}$ , and  $\tilde{e} = \Psi_{h/2,p+1} - \Pi_{hp} \Psi_{h/2,p+1}$ .

Compute  $\epsilon = G_{h/2,p+1} - G_{hp}$ , and  $\tilde{\epsilon} = G_{h/2,p+1} - \Pi_{hp} G_{h/2,p+1}$ .

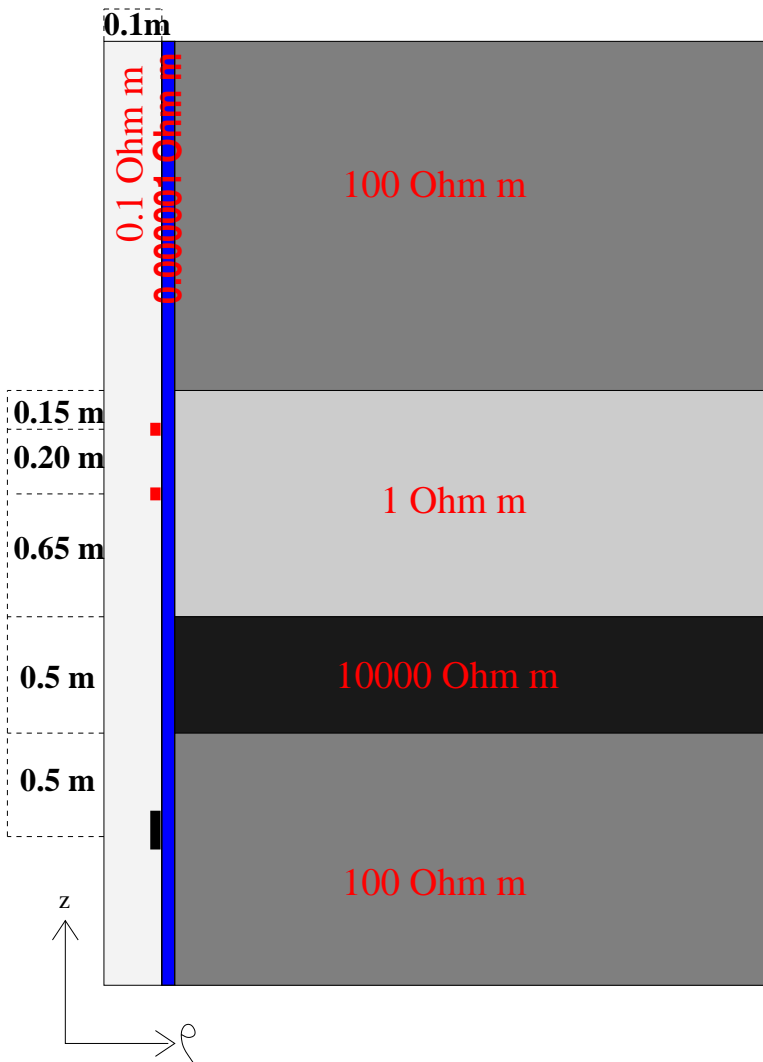

$$|L(e)| = |b(e, \epsilon)| \sim |b(\tilde{e}, \tilde{\epsilon})| \leq \sum_K |b_K(\tilde{e}, \tilde{\epsilon})| \leq \sum_K \| \tilde{e} \|_{E,K} \| \tilde{\epsilon} \|_{E,K}.$$

Apply the fully automatic  $hp$ -adaptive algorithm.

# SELF-ADAPTIVE GOAL-ORIENTED *hp*-FEM

## Model Problem with Steel Casing

Frequency: 10 Hz - 10 kHz.

Casing resistivity:  $10^{-6}$  Ohm · m.

Casing width: 0.01127 m

Discretization error < 0.1 %

Toroidal antennas

Size (domain): 500m x 4000m

IBM Power 4 compiler 1.3 Ghz (4 years old)

Possible improvements in performance:

- To use a 3.4 Ghz processor.
- To execute the code in 8 processors (10 positions per processor).
- To improve implementation.

## CONCLUSIONS AND FUTURE WORK

---

- The self-adaptive goal-oriented  $hp$ -adaptive strategy converges exponentially in terms of a **user-prescribed quantity of interest** vs. the CPU time.
- We obtain fast, reliable and accurate solutions for problems with a large dynamic range and high material contrasts.

### Future Work

- To apply the self-adaptive goal-oriented  $hp$ -FEM to 3D problems for simulation of deviated wells.
- To apply the self-adaptive goal-oriented  $hp$ -FEM for inversion of 2D multi-physic problems.
